

Stage V Magni telehandlers for Beyer-Mietservice

10 November 2020

Beyer-Mietservice, headquartered in Westerwald, Germany, has added 40 Stage V Magni rotating telescopic handlers to its rental fleet, with a load capacity of 7t and lifting height of 29.8m.

“Magni is the first and currently the only manufacturer on the market of Stage V-compliant rotating telescopic handlers in this performance class,” said the manufacturer.

Beyer-Mietservice is the first rental company in Germany to have these Stage V-compliant machines. The company, which operates throughout Europe, stated this was an important factor when selecting new machines and equipment for its rental fleet. Riccardo Magni—managing director at Magni—and his son Carlo Magni, vice president, visited Beyer-Mietservice’s facility for the handing-over of the telescopic handlers.

The new Magni rotating telescopic handlers include a range of attachments for multifunctional use as cranes, working platforms and forklifts: winches, hooks, heavy-duty buckets and working platforms, telescopic hooks, platforms with winches and jibs. Equipping the machines with a Twin Energy-System, Magni has opened up their use in other sectors, especially in areas that require emission-free solutions.

Another important feature is the automatic attachment recognition. When an attachment has been successfully installed, the automatic attachment recognition on the boom head activates live corresponding load diagram on the multifunctional display and load moment limitation.

Magni’s remote control offers a clear view of the machine, application area and attached load. It can also be used for hydraulic movements such as raising and lowering the telescopic arm.

The official handing-over was attended by with Alexander Reisch (sales manager Magni Deutschland), Riccardo Magni (managing director) and Carlo Magni (vice president).
