FORESTRY KIT

The forestry kit is your all in one solution for green area maintenance.

The tree cutter consists of a grip saw, ideal solution for pruning trees and branches. The **Power Tiltator** allows the clamp to rotate 360°, allowing the branch or trunk to be cut from any position or angle. Chain lubrication uses grease. Compared to lubrication with oil, lubrication with grease does not cause any atomisation, thus protecting the work area and the cab windscreen from soiling. Grease also stays on the chain much longer, minimising wear and maintenance. The chain tensioner is automatic, ensuring the chain is always tensioned. **Available for RTH models.**

Fields of application:

- Safely removing trunk sections in all positions.
- Collecting trunks
- Maintenance of road verges and railway embankments
- Felling of hazardous trees
- Rapid processing of already felled trees on the ground

(ATT-08-001 on attachments catalogue)

SAFETY FEATURES & DEDICATED LOAD CHART

At Magni, safety is our priority. Thus, our engineers have designed this kit to provide full operator protection even during the most delicate operations.

Our machines feature load detection sensors and the LMI system with a customized load chart, designed specifically for this kit. On models equipped with the forestry kit, additional safety systems can be requested (such as the safety button for saw operation in the cab and on the remote control).

REMOTE CONTROL FOR TREE CUTTING WITH DISPLAY

OPT-02-011

OPTIONAL

For this forestry kit we developed a special remote control which allows to perform all normal cab operations and specific movements of the tree cutting attachment, making the job safer and more efficient. The remote control is equipped with a practical colour display which shows all boom geometric data to the user on the ground, increasing operator safety. Thanks to the Bluetooth system it can be used all over the world without restrictions.

PRE-ARRANGEMENTS REQUIRED

(must be ordered separately)

PRE ARRANGEMENT FOR TREE CUTTING DEVICE

OPT-05-001

This option prepares the machine for safe use with the tree cutting attachment and equips the cabin with a protection grid on the windshield, additional rollers on the joysticks for tree cutting operations, cameras with protections and dedicated HD screen in the cab, front and rear cab working lights and special filter featuring F7 filter class (CEN EN 779).

BOOM PROTECTION FOR TREE CUTTING DEVICE AND DUSTY ENVIRONMENTS

OPT-05-005

This option is designed to protect the boom and its sections thanks to a metal plate mounted into each of the boom hollows and additional gaskets at the end of every boom section. This prevents sawdust and debris from entering the boom sections.
