

MAGNI SRL. LAUNCH NEW RANGE OF FIXED BOOM TELEHANDLERS

A new range of telehandlers has recently been launched by Italian company Magni Srl. The Magni TH range consists of 9 fixed boom telescopic handlers from 5 to 6 tonne capacity and 8m to 19m lift height. These machines join the 20m and 24m lift height machines that were launched a few years ago. Powered by a Deutz 55 kW or 75 kW Stage V engine, all the machines conform to the latest emissions regulations.

The hydrostatic transmission of the TH range offers precision and manoeuvrability. This

machine is compatible with a wide range of attachments. It is equipped with the RFID system which allows for automatic recognition of attachments and the creation of the relative load charts.

So, what sets the Magni range apart in an already crowded market place. Magni have used their expertise gained in the production of Rotational Telehandlers, where they have become known for their innovation and quality and, transferred this technology into their telehandlers. What does this mean in real terms? It means that Magni have real time load information with the

safety systems of a Rotational handler. The machines also have the same cab with unmatched visibility and integrated air condition on the higher-powered models. CanBus electrical circuit, Load sensing high pressure hydraulic system and touch screen display are also features lifted straight from the company's range of Rotational telehandlers.

Low boom pivots and compact dimensions give the machines a small profile that belies the lift height and capacity. The Magni machines are built with heavy duty axles. It also means that the TH range can be fitted with attachments such as winches,
